

Meditherm DITI

An extremely valuable test to help in the early detection of breast disease.

Your results are reported quickly by certified doctors and include all color images taken during your test.

Current Early Detection Guidelines

One day there may be a single method for the early detection of breast cancer. Until then, using a combination of methods will increase your chances of detecting cancer in an early stage. These methods include :

- Annual DITI screening for women of all ages.
- Mammography, when considered appropriate for women who are aged 50 or older.
- A regular breast examination by a health professional.
- Monthly breast self-examination.
- Personal awareness for changes in the breasts.
- Readiness to discuss quickly any such changes with a doctor.

These guidelines should be considered along with your background and medical history.

“Early Detection Saves Lives”

DITI's role in breast cancer and other breast disorders is to help in early detection and monitoring of abnormal physiology and the establishment of risk factors for the development or existence of cancer. When used with other procedures the best possible evaluation of breast health is made.

Increase your chances of detecting breast cancer in its earliest stages.
